Image 1 by 11hearthstone: Heroes of Warcraft is a fun, free and fair digital collectible card game that you won't be able to stop playing. Playing as one of the great heroes (or villains) of the Warcraft universe — such as Thrall, Jaina Proudmoore, or Gul'dan — you'll fight epic duels and convoy with allies and minions by your side. Easy-to-learn rules work cross-platform between PC, iPad, and Android players. You can earn gold that can be spent on envelopes. In addition, in Arena mode you can play in a special sealed draft format that rewards the construction of cammy decks and smart play. There are, however, a few things to consider before you can successfully do so. First, you will need to prepare your phone settings. Secondly, you will get the file on your Android. And finally, find the file to open it. The following information should apply regardless of who made your Android phone: Samsung, Google, Huawei, Xiaomi, etc. An Android Package Kit (APK) is a file type that installs an application for Android. If you're technically experienced, it's like a file you run to install programs on Windows or Mac (known as executable (EXE) for Windows or a package installer (PKG) for Mac). In this case, the APK file is simply the installation file that you click to install the applications on your Android device. Here is a simplified explanation of what an APK is, but it helps to understand why clicking on the file on your Android device will install an application. If you have ever installed an Android application from the Google Play Store, you have actually already used an APK file without realizing it. When you click that green installation button, Google Play automates the process of transferring the APK file to your phone and running for you. But what if the app you want to install isn't available on Google Play? That's when you're going to have to take the situation into your hands. In this article you will learn three methods to run an APK installation file to install any non-Google Play app on your phone. Since your phone considers any application outside of Google Play an unknown app, you need to tell your phone to allow you to install unknown apps. Go to Settings, Tap Security (or Lock screen and Security). Scroll down to the Device Administration section and enable Unknown Sources. Go to Settings. Then apps and notifications. Select Install unknown apps (or Install other apps). Now that you have set up your phone to allow the installation of unknown apps, you will also need a way to find that application file (APK file) on your phone so be able to execute it. Android phones are typically available with a File Manager app that you can use. But if you don't have one, open Google Play on your phone and search for File Manager. You will see many options available. Some of the best options include Cx File ExplorerEZ File ExplorerFile Manager Install any any these file managers so that you are able to locate the APK file after transferring it to your phone. The easiest way to install an APK file on your Android is to download the file using your Android browser. Once you find a website that offers an Android app, you will see a link to download the APK file. You may see a pop-up asking you if you want to let your browser save files in your phone's memory. Accept this. You will also see an alert that This type of file can damage your device. Just click OK to continue. If your phone's web browser doesn't open the file after downloading, open the installed file explorer app and navigate to the Downloads folder on your device. Tap the APK file. Allow the app all the necessary permissions it requires. Then, at the bottom of the installation window, click INSTALL. You'll see confirmation that you're installing the app. Now you'll see the app available in the list of installed apps. If you don't have internet access on your phone or for any other reason you can't use your browser to download the file, you can still install apps from your computer. Using your computer's web browser, download the APK file just as described above. Once downloaded, you will need to connect to your Android phone and transfer the file. If you have never connected android to your computer, you will need to enable USB debugging. Depending on how old your device is, there are two ways to do it. Android 4.1.x and lower versions: Click Settings, click Applications, click Development, and then click Enable USB Debugging. Android 4.2.x and earlier: Click Settings, scroll down to About your phone, and tap Create number seven times. This enables the Development menu. Go back to Settings, tap Developer Options and USB Debugging. Enable the USB debugging check box. Once enabled, you can connect your phone to your computer with a USB cable and your phone will be mounted just like it would with a memory stick. Once connected to your computer, your phone will be shown as another drive in Your Computer's File Explorer. Move the downloaded APK file from the app's website to your phone. Find the downloaded APK file on your computer. Right-click the file, and then click Copy. Find the new drive for your phone in File Explorer. Expand each folder until you find the /sdcard/download folder. Paste the APK file into that folder. Once the file is transferred, use the file explorer app on your phone as described in the previous section to tap the APK file and install the app. If you do not have a usb cable another solution is to install the wifi ftp server from google play and then use an ftp client on your computer (such as filezilla) to transfer the apk file from your computer to your computer /sdcard/download on your phone. However, this is an advanced option and requires an understanding of how to use FTP files. If for any reason the APK installer is not running when you tap it on your phone or the app launcher has stopped abnormally and the phone is not working properly, there is emergency, advanced solution that will work. You can install the APK file on your Android from your computer using a tool called Minimal ADB and Fastboot. First, you'll need to follow the steps in the previous section to connect your phone via USB and enable USB debugging. Then, download and install the latest version of Minimal ADB and Fastboot on your computer. Run the tool and a command window appears. With your phone connected to your computer with the USB cable, type the adb device command. If the tool can detect your phone, you'll see an ID for the device listed under List of connected devices. Now you are ready to transfer the APK file. Using Windows File Explorer, find the downloaded APK file on your computer. Right-click the file, and then click Copy. Using Windows File Explorer, navigate to the Minimal ADB and Fastboot folder (typically c:\Program Files (x86)\Minimal ADB and Fastboot). Paste the APK file into that folder. Rename the APK file to something short, so it's easy to type as a command. In the same command window that you opened earlier, type the adb install <name-of-file.apk> command. Replace <name-of-file.apk> with the name of the APK file. When you see the word Success, the app is installed on your phone! There are many websites where you can find non-Google Play apps to install. Three of the most popular are Pure APKs, Reddit's APK directory, and Mirror APK. Remember to do your research before installing any app. Often a quick Google search can let you know if an app (or an app company) has a questionable reputation. Seriously, do your research before downloading and installing the APK on your Android device. Device. </name-of-file.apk></name-of-file.apk>;
